

"Last" lecture for this part of the course for this section

"Journey"

→ Expose you to Modern QM.
- Mathematical Foundation (~1925)
→ "H-atom" Problem

(SE)

AO
pictorial
view (1e⁻ wavefⁿ) coordinate frame

Spin condition
"e"

→ full wavefⁿ →

electron-electron
repulsion

Pauli Exclusion Principle
(antisym. of wavefⁿ)
↓
4 quantum #s.

Ignore $e^- - e^-$ repulsion: He

e^- Configurations

Aufbau Principle
Hund's Rule

Radial part $(n-l-1)$ nodes:

Angular " \rightarrow "l" nodes

$(n-1)$ Total nodes

Molecules

$1e^-$ case \rightarrow

e^-

LCAO

$$H\psi = E(R)\psi$$

diff. "R" values.

Born - Oppenheimer Approx.

Bonding
Antibonding
Non bonding

σ_2 configuration

Franck - Condon "Principle"

"Electronic Spectroscopy"

Bond Order

$$\rightarrow \frac{1}{2} (N_B - N_A)$$

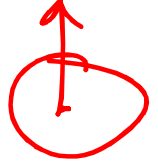

Rotational Spectroscopy

Applied field & molecule

→ Dipole approximation

1st eg.

"E" → 

Charge Dipole formation

non-symmetry
